NSS Enterprises, Inc.

**Charger Series
Battery Burnishers**

- HIGH SHINE
- LOWER MAINTENANCE AND FUEL COSTS
- SUPERIOR DUST COLLECTION
- QUIET AND ERGONOMIC
- NO EMISSIONS OR ODOR

SHINE LIKE A PROPANE BURNISHER

A propane burnisher has one thing going for it, constant pad speed. Until the Charger Series Burnishers, a battery burnisher's pad speed decreased as the batteries were discharged. With that in mind, we tuned the Charger Series Burnishers to run at their top speed—even at the battery pack's lowest charge. Couple that with plenty of pad pressure and you have a propane-like shine without the noise, the emissions, the maintenance costs and the fuel costs associated with propane burnishers.

SPECIAL FEATURES

The Charger Series Burnishers are like no other burnishers on the market.

FLIP-UP PAD CHANGE POSITION

The flip up head on the Charger Series Burnishers lets your employees maintain an ergonomically correct position while changing the pad. It also lets the Charger fit into tight places for storage and makes it easy to transport.

ADD A SULKY

Increase productivity without much cost. The flip up sulky lets you ride when you want to and walk when you need to. Impressive? The voters at the 2008 ISSA Show in Las Vegas thought so when they voted it the Most Innovative New Product.

USE OUR EXPERIENCE TO YOUR ADVANTAGE

NSS Enterprises set out on a mission to provide a good alternative to propane burnishers. The Charger Series Burnishers do just that.

The Charger Series Burnishers shine like propane burnishers, eliminate noise and emissions, provide easy pad changes and a sulky option, and provide an obvious advantage in cost of operation.

MAINTAIN INDOOR AIR QUALITY

It's no secret that propane burnishers emit carbon monoxide. The Charger Series Burnishers are emission free.

It's also no secret that burnishing creates dust. To protect the immediate environment and HVAC system, we've designed our most effective dust collection system ever. Underneath the skirt, a molded chamber directs air up through filter bag. The filter bag is made of a three layer non-woven polypropylene high efficiency filter material.

Filtration systems are only effective when the filters are properly maintained. To promote proper maintenance, the filter bag is placed out in the open where operators will see it every day.

LOWER OPERATING COSTS

If you're still buying propane burnishers because they're lower in price, you're not looking at the whole picture. In addition to the cost of propane itself, consider the parts required to keep a burnisher running for a year. Compare the diagrams on the right and the choice is easy. Charger burnishers are easier to maintain, with less hassle and cost, than **any** propane burnisher. Replace the carbon brushes and drive chain annually and grease the casters every couple of months and you're done.
